

URL Checker

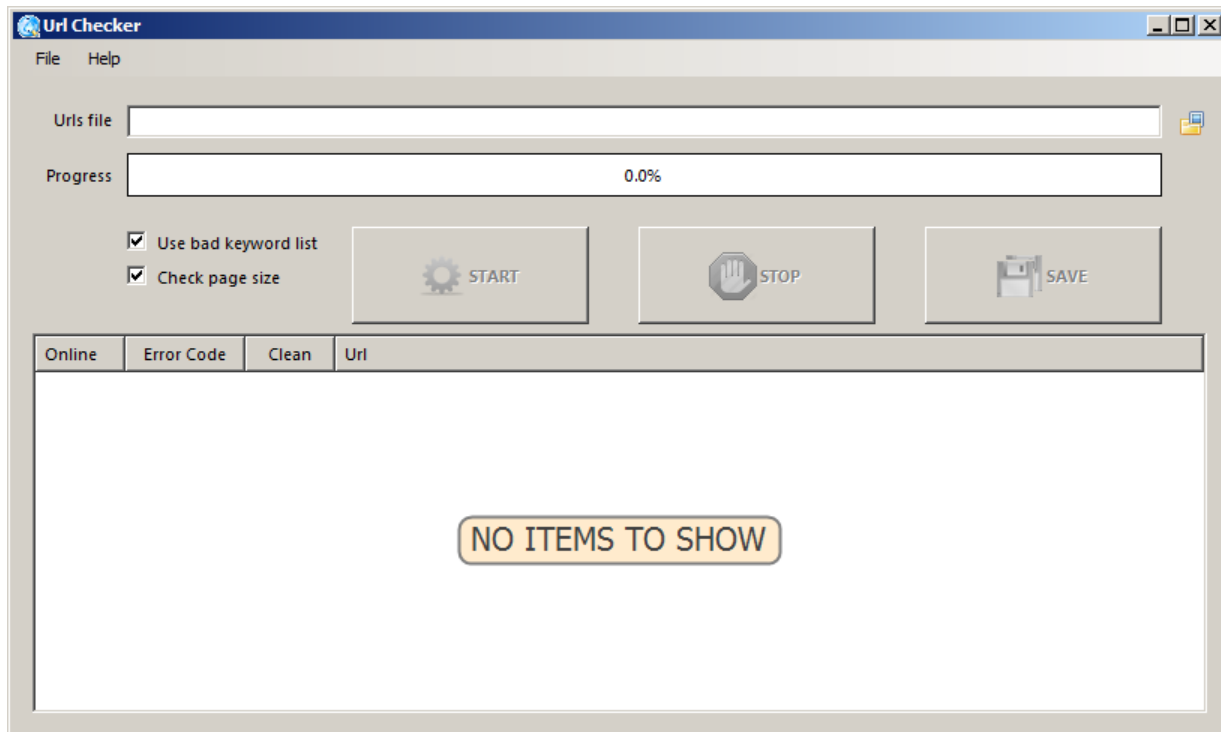

(c) [Randombyte](#) – All rights reserved

Congratulations for downloading URL Checker! It is a useful application that runs on Windows-based computers and can determine if your website is down or if it has been hacked.

The program archive contains 5 files: UrlChecker.exe (the actual application), a list of sites (sites.txt), a list of bad keywords (badkeywords.txt), options.xml and manual.pdf, the document that you are reading right now. Unzip the archive, double click the sites.txt file, and then add all the sites that you plan to monitor, using a separate line for each site. You can safely remove the existing websites, of course.

Run UrlChecker.exe and you will see the main program window.

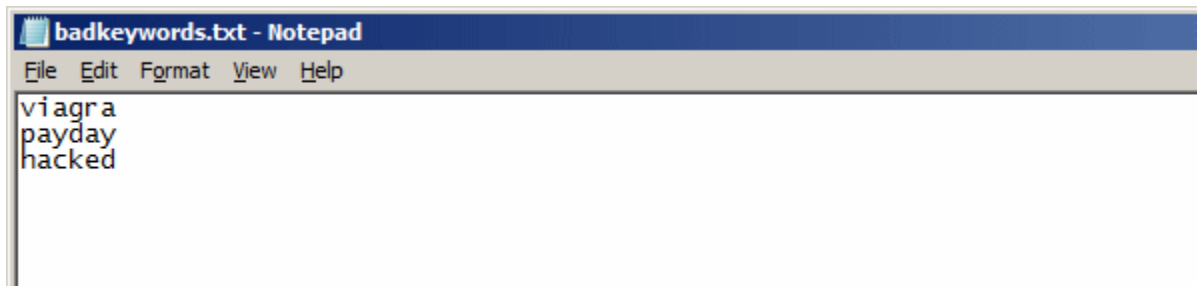

Use File -> Open URLs or click the small icon at the right side of the "Urls file" field to open your sites.txt file, and then press "Start". The program will check each URL, telling you if it is offline or hacked.

The hacking discovery mechanism uses two different methods: a bad keywords list defined by you and a website page size check. The bad keywords list check should be used each time. The website page size check should only be used if your sites are html-based, static websites.

WARNING: if your sites are dynamic (think WordPress, etc.) and you use "Check page size", you will get "hacked" messages even if your sites may be clean, because the pages are generated dynamically, so their sizes can change. However, if your sites are 100% static, click the "Save" button to save the current website page sizes at the end of the first program run. Choose the "Check page size" method only if you are using html-based websites, though.

The program folder includes a starter badkeywords.txt file. Open the application folder, and then double click the badkeywords.txt file to open it. Add or remove bad words, making sure that each new word is placed on a separate line.

If you get stuck you can always read the built-in manual by accessing the "Help" menu. I hope that you will find this tool to be useful; I know I do, because I use it on a regular basis.

URL Checker is 100% free and doesn't contain any malware, viruses, etc. For more information, internet marketing tools and services, visit <https://www.randombyte.com/>
